#### NEURAL NETWORKS

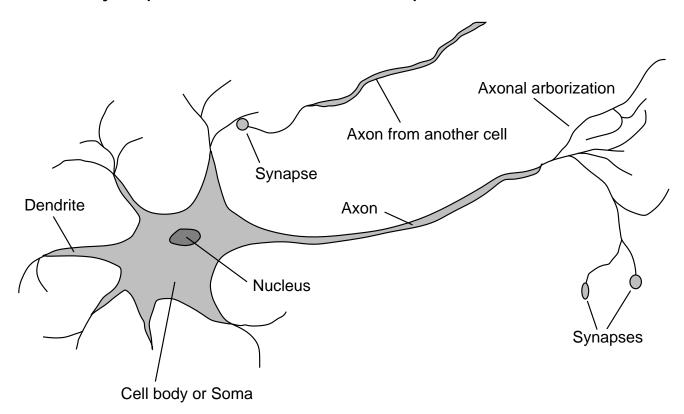

Chapter 20, Section 5

## Outline

- $\Diamond$  Brains
- ♦ Neural networks
- $\Diamond$  Perceptrons
- ♦ Multilayer perceptrons
- $\Diamond$  Applications of neural networks

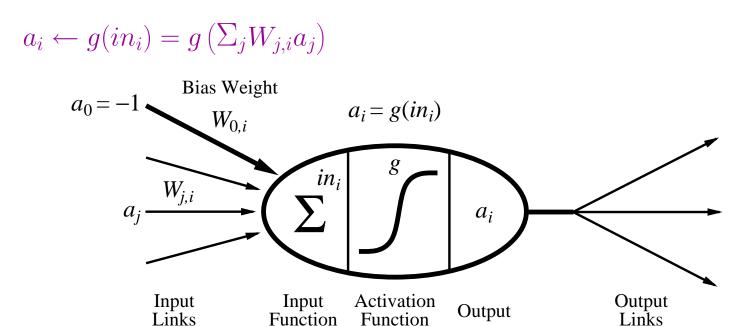

#### **Brains**

 $10^{11}$  neurons of >20 types,  $10^{14}$  synapses, 1ms–10ms cycle time Signals are noisy "spike trains" of electrical potential

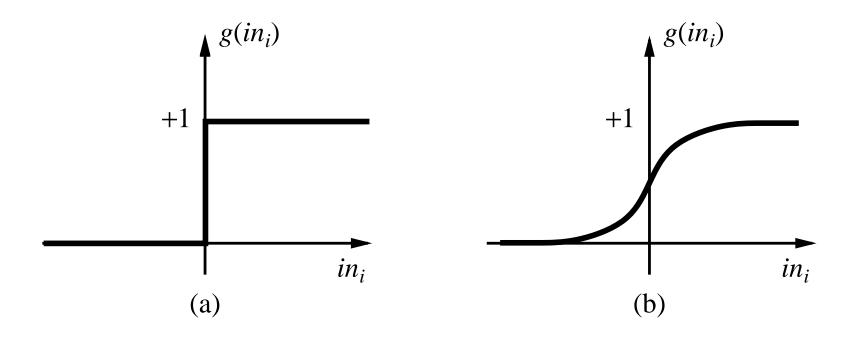

#### McCulloch-Pitts "unit"

Output is a "squashed" linear function of the inputs:

A gross oversimplification of real neurons, but its purpose is to develop understanding of what networks of simple units can do

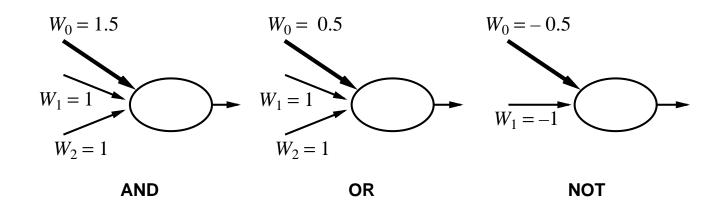

### **Activation functions**

- (a) is a step function or threshold function
- (b) is a sigmoid function  $1/(1+e^{-x})$

Changing the bias weight  $W_{0,i}$  moves the threshold location

## Implementing logical functions

McCulloch and Pitts: every Boolean function can be implemented

#### Network structures

#### Feed-forward networks:

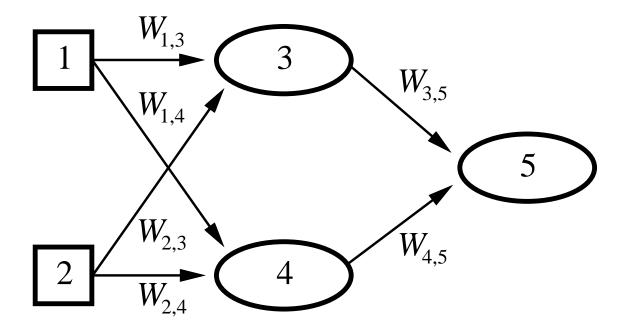

- single-layer perceptrons
- multi-layer perceptrons

Feed-forward networks implement functions, have no internal state

#### Recurrent networks:

- Hopfield networks have symmetric weights  $(W_{i,j} = W_{j,i})$  g(x) = sign(x),  $a_i = \pm 1$ ; holographic associative memory
- Boltzmann machines use stochastic activation functions,  $\approx$  MCMC in Bayes nets
- recurrent neural nets have directed cycles with delays
  - ⇒ have internal state (like flip-flops), can oscillate etc.

#### Feed-forward example

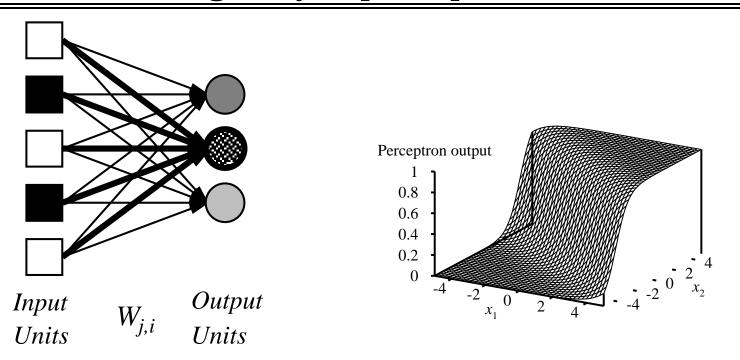

Feed-forward network = a parameterized family of nonlinear functions:

$$a_5 = g(W_{3,5} \cdot a_3 + W_{4,5} \cdot a_4)$$
  
=  $g(W_{3,5} \cdot g(W_{1,3} \cdot a_1 + W_{2,3} \cdot a_2) + W_{4,5} \cdot g(W_{1,4} \cdot a_1 + W_{2,4} \cdot a_2))$ 

Adjusting weights changes the function: do learning this way!

# Single-layer perceptrons

Output units all operate separately—no shared weights

Adjusting weights moves the location, orientation, and steepness of cliff

### Expressiveness of perceptrons

Consider a perceptron with g = step function (Rosenblatt, 1957, 1960)

Can represent AND, OR, NOT, majority, etc., but not XOR

Represents a linear separator in input space:

Minsky & Papert (1969) pricked the neural network balloon

#### Perceptron learning

Learn by adjusting weights to reduce error on training set

The squared error for an example with input x and true output y is

$$E = \frac{1}{2}Err^2 \equiv \frac{1}{2}(y - h_{\mathbf{W}}(\mathbf{x}))^2 ,$$

Perform optimization search by gradient descent:

$$\frac{\partial E}{\partial W_j} = Err \times \frac{\partial Err}{\partial W_j} = Err \times \frac{\partial}{\partial W_j} \left( y - g(\sum_{j=0}^n W_j x_j) \right)$$
$$= -Err \times g'(in) \times x_j$$

Simple weight update rule:

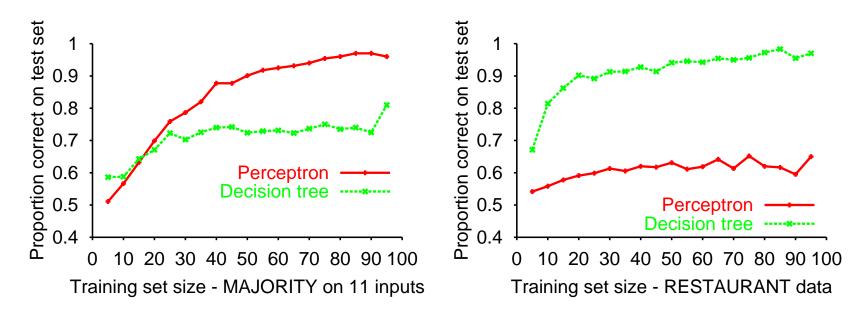

$$W_j \leftarrow W_j + \alpha \times Err \times g'(in) \times x_j$$

E.g., +ve error  $\Rightarrow$  increase network output

 $\Rightarrow$  increase weights on +ve inputs, decrease on -ve inputs

### Perceptron learning contd.

Perceptron learning rule converges to a consistent function for any linearly separable data set

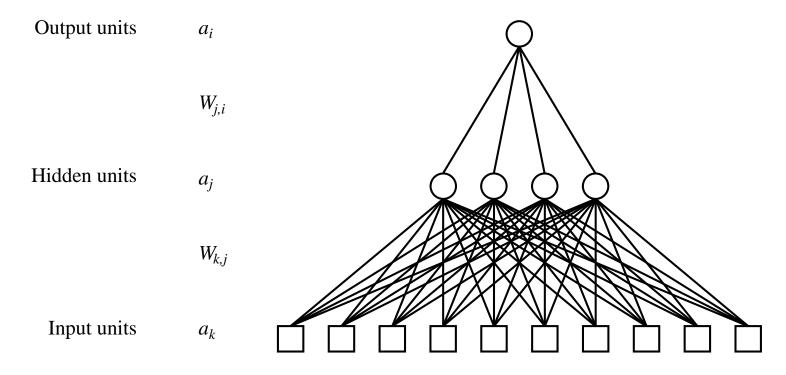

Perceptron learns majority function easily, DTL is hopeless

DTL learns restaurant function easily, perceptron cannot represent it

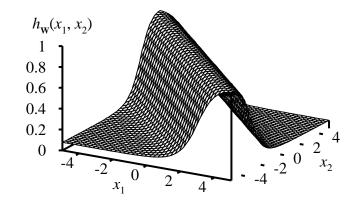

# Multilayer perceptrons

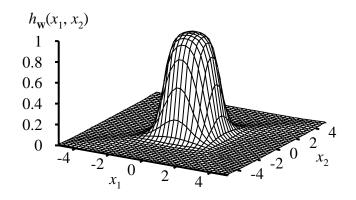

Layers are usually fully connected; numbers of hidden units typically chosen by hand

## Expressiveness of MLPs

All continuous functions w/2 layers, all functions w/3 layers

Combine two opposite-facing threshold functions to make a ridge

Combine two perpendicular ridges to make a bump

Add bumps of various sizes and locations to fit any surface

Proof requires exponentially many hidden units (cf DTL proof)

## Back-propagation learning

Output layer: same as for single-layer perceptron,

$$W_{j,i} \leftarrow W_{j,i} + \alpha \times a_j \times \Delta_i$$

where 
$$\Delta_i = Err_i \times g'(in_i)$$

Hidden layer: back-propagate the error from the output layer:

$$\Delta_j = g'(in_j) \sum_i W_{j,i} \Delta_i .$$

Update rule for weights in hidden layer:

$$W_{k,j} \leftarrow W_{k,j} + \alpha \times a_k \times \Delta_j$$
.

(Most neuroscientists deny that back-propagation occurs in the brain)

#### Back-propagation derivation

The squared error on a single example is defined as

$$E = \frac{1}{2} \sum_{i} (y_i - a_i)^2 ,$$

where the sum is over the nodes in the output layer.

$$\frac{\partial E}{\partial W_{j,i}} = -(y_i - a_i) \frac{\partial a_i}{\partial W_{j,i}} = -(y_i - a_i) \frac{\partial g(in_i)}{\partial W_{j,i}} 
= -(y_i - a_i) g'(in_i) \frac{\partial in_i}{\partial W_{j,i}} = -(y_i - a_i) g'(in_i) \frac{\partial}{\partial W_{j,i}} \left(\sum_j W_{j,i} a_j\right) 
= -(y_i - a_i) g'(in_i) a_j = -a_j \Delta_i$$

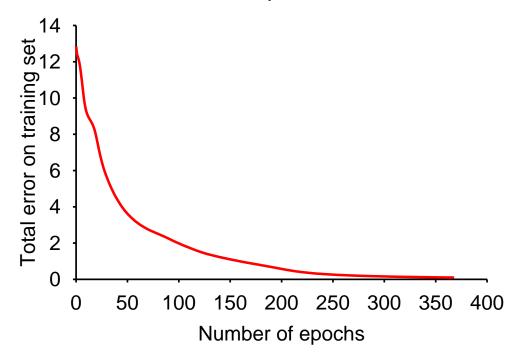

#### Back-propagation derivation contd.

$$\frac{\partial E}{\partial W_{k,j}} = -\sum_{i} (y_i - a_i) \frac{\partial a_i}{\partial W_{k,j}} = -\sum_{i} (y_i - a_i) \frac{\partial g(in_i)}{\partial W_{k,j}} 
= -\sum_{i} (y_i - a_i) g'(in_i) \frac{\partial in_i}{\partial W_{k,j}} = -\sum_{i} \Delta_i \frac{\partial}{\partial W_{k,j}} \left( \sum_{j} W_{j,i} a_j \right) 
= -\sum_{i} \Delta_i W_{j,i} \frac{\partial a_j}{\partial W_{k,j}} = -\sum_{i} \Delta_i W_{j,i} \frac{\partial g(in_j)}{\partial W_{k,j}} 
= -\sum_{i} \Delta_i W_{j,i} g'(in_j) \frac{\partial in_j}{\partial W_{k,j}} 
= -\sum_{i} \Delta_i W_{j,i} g'(in_j) \frac{\partial}{\partial W_{k,j}} \left( \sum_{k} W_{k,j} a_k \right) 
= -\sum_{i} \Delta_i W_{j,i} g'(in_j) a_k = -a_k \Delta_j$$

## Back-propagation learning contd.

At each epoch, sum gradient updates for all examples and apply

Training curve for 100 restaurant examples: finds exact fit

Typical problems: slow convergence, local minima

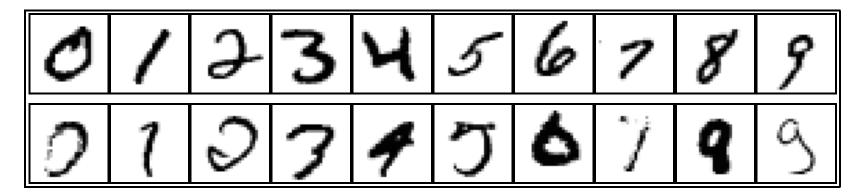

### Back-propagation learning contd.

Learning curve for MLP with 4 hidden units:

MLPs are quite good for complex pattern recognition tasks, but resulting hypotheses cannot be understood easily

## Handwritten digit recognition

3-nearest-neighbor = 2.4% error

400-300-10 unit MLP = 1.6% error

LeNet: 768-192-30-10 unit MLP = 0.9% error

Current best (kernel machines, vision algorithms)  $\approx 0.6\%$  error

#### Summary

Most brains have lots of neurons; each neuron  $\approx$  linear–threshold unit (?)

Perceptrons (one-layer networks) insufficiently expressive

Multi-layer networks are sufficiently expressive; can be trained by gradient descent, i.e., error back-propagation

Many applications: speech, driving, handwriting, fraud detection, etc.

Engineering, cognitive modelling, and neural system modelling subfields have largely diverged
